Module specification: template

English version of ../../modules/module-template.md.

Copy it to `docs/modules/<name>.md`. All 11 sections are mandatory — `scripts/docs-check.sh` verifies them in CI.

1. Purpose and boundaries

What the module does, what it does not do, where its responsibility ends.

2. Use scenarios

User or system → what happens → what is observable, including failures.

3. Contract

Routes, schemas, events, error codes; a reference to `backend/openapi.json`.

4. Data

Which tables or files the module writes (it is the only writer) and what it reads through other contracts. Snapshot, aggregates, provenance.

5. Access rules

Who has access, what happens on refusal, how it is verified.

6. Dependencies

Incoming (who calls it) and outgoing (whom it calls), the port or adapter for an external system.

7. Configuration

`AEZA_*` variables with defaults, whether they are mandatory, and the consequences of a wrong value.

8. Build and debug

How to run just this module, how to reproduce the behaviour locally.

9. Tests

Which tests prove what (files, test names).

10. Observability

Logs, metrics, error codes, what the operator does on failure.

11. Limitations and readiness

Known limitations, what was deliberately left out, readiness criteria.
